

Automated transport systems – as subscription!

Renting instead of buying ?

How is this organized?

The realisation is divided into three parts:

1. Planning

We discuss your requirements and design your transport and control system.

2. Integration

Once we have provided your desired vehicle, we integrate it into your production environment. This also includes the necessary system and function tests in your company.

3. Utilisation

You use the system for the agreed period and decide for yourself when an extension, customisation or perhaps even termination is required.

As your partner, we support you right from the start without you losing extensive resources! And if the test phase was not satisfactory, the lease can be terminated.

"Ideas in motion."

We support you in realising your ideas and get them moving.

What is included in the rental?

We provide you with the entire transport system required for the transport task. This consists of:

- Transport vehicle
- Software for controlling the transport tasks
- Touchpad with intuitive user interface for controlling transport tasks

What benefits do I have as a customer?

Particularly when it comes to the introduction of new technologies in your own company, there are often concerns:

- Do we have the expertise to realise the project successfully?
- Who can supervise the integration?

We support you with your ideas and want to set your requirements in the best possible way.

Automated transport systems – as subscription!

How much will it actually cost me?

We have kept your rental concept very simple. There are two cost areas:

1. Integration

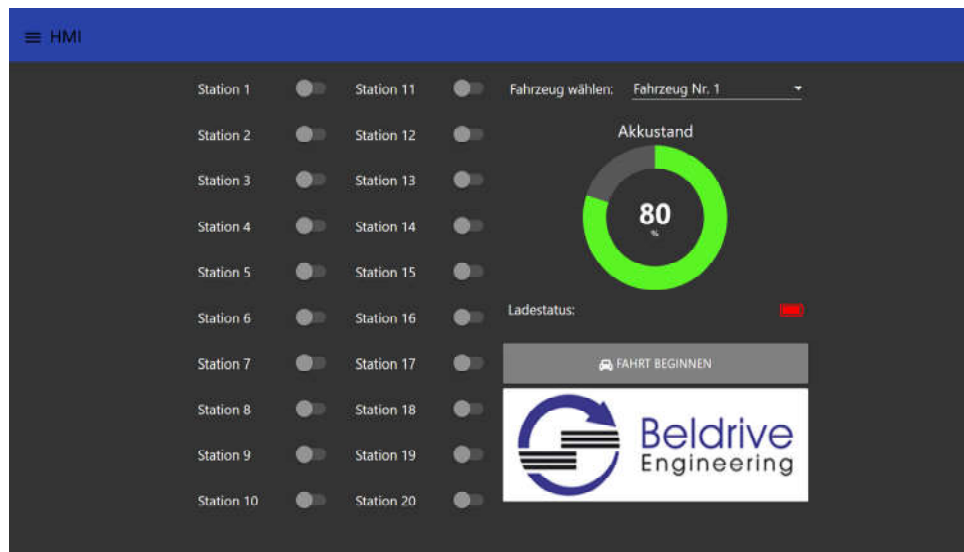

Every user has individual requirements. One company is smaller, another larger. We charge for planning and integration depending on the scope required. Once integration is complete, we invoice this service separately.

2. Rental phase

The rental phase usually runs for **24 months from 800 €* per vehicle and month**. During this time, the rental period can be extended or reduced as required, depending on how your experience and requirements develop.

We would be happy to support you with your ideas and provide you with a free, no-obligation quote.

*Subject to equipment options

The user can intuitively control the transport tasks via a touchscreen.

Does it pay off?

- In times of staff shortages and staff absences, we will provide you with a “new employee” for the required period who will be happy to work overtime and double shifts for you!
- The rental model is cheaper than minimum wage and mini-jobs.
- You do not need to provide your own resources to optimise your production. We bring experience from numerous projects with automotive manufacturers and medium-sized companies to your production.
- If the expected successes do not materialise, you can return the entire system. Without losses that would have occurred with a large investment.
